- Real-time event synchronization is the process of instantly updating multiple systems when an event occurs.
- It ensures that all connected applications or devices stay consistent and up to date.
- An event can be any action such as a user click, transaction, message, or sensor update.
- When an event happens, it is immediately detected and transmitted to other systems.
- The systems process the event and update their data without noticeable delay.
- It commonly uses event-driven architecture and message brokers like Apache Kafka.
- This approach improves responsiveness, coordination, and The Academic Campus Event & Registration Portal is a web-based platform designed to manage and organize campus events efficiently.
- It provides a centralized system for creating, publishing, and managing academic and non-academic events such as seminars, workshops, symposiums, conferences, technical fests, and cultural programs.
- The portal allows students to browse available events and register online easily. It eliminates manual paperwork and reduces administrative workload.
- The system ensures secure user authentication for students and administrators.
- It provides real-time updates about event schedules, registration status, and announcements. The platform maintains accurate digital records of event participation.
- It improves communication between event organizers and students.
- The portal is designed to be user-friendly, responsive, and accessible from any device.
- Overall, it enhances efficiency, transparency, and participation in campus events. user experience.
- It is widely used in chat apps, online gaming, stock trading, and IoT systems.

PROBLEM STATEMENT

1

2

Problem definition_- Academic Campus Event & Registration Portal

3

In many colleges and universities, campus events are managed manually through paper-based registrations, spreadsheets, notice boards, and informal communication channels such as emails and messaging groups. This fragmented approach often leads to miscommunication, data loss, duplication of entries, and lack of proper coordination between students and organizers. Students may miss important announcements or deadlines due to the absence of a centralized information system.

4

5

6

7

8

9

Event organizers face challenges in tracking registrations, managing participant limits, verifying eligibility,

and generating reports. Maintaining historical records of events and participant data becomes difficult without a structured digital database. Additionally, manual systems consume more time, increase administrative workload, and are prone to human errors.

Therefore, there is a need for an integrated, secure, and user-friendly digital platform that can streamline event management, improve communication, ensure accurate record-keeping, and enhance overall efficiency in organizing academic campus events.

OBJECTIVE(S)

1

2

3

4

5

6

7

8

9

- To develop a centralized digital platform for managing campus events efficiently.
- To simplify and automate the event registration process for students.
- To reduce paperwork and administrative workload through digital record management.
- To provide real-time updates and improve communication between organizers and students.
- To ensure secure, transparent, and accurate tracking of event participation data.

PROPOSED SYSTEM

1

- The system is a centralized web-based platform for managing all campus events digitally.
- It allows administrators to create, update, delete, and publish event details such as date, time, venue, description, and participant limits.

2

- Students can securely register, log in, browse upcoming events, and register online.

3

- The system provides instant registration confirmation and real-time updates.

4

- It maintains a structured digital database to store event and participant records. Ø Role-based access control ensures secure access for administrators and students. Ø The portal enables real-time tracking of registrations and participant limits.

5

- Automated notifications and announcements keep students informed about important updates.

6

- The system generates reports and maintains historical event data for future reference

7

8

9

Proposed System Architecture

Workflow Diagram

TECHNOLOGIES USED

Frontend Technologies

HTML5 – Structure of web pages

CSS3 – Styling the web pages (layout, colors, design)

JavaScript – Client-side validation (form validation, alerts)

Bootstrap – Responsive design and UI components

(optional) Backend Technologies

PHP – Server-side scripting and backend development

MySQL – Database for storing event and registration

data phpMyAdmin – Database management tool

Apache Server (XAMPP) – Local server to run PHP and MySQL

Database

MySQL – Stores event details, student details, registrations

SQL – Used for database queries (INSERT, SELECT, UPDATE, DELETE)

Tools & IDE

XAMPP – Local server environment (Apache + MySQL) VS

Code / Notepad++ – Code editor for PHP, HTML, CSS

phpMyAdmin – Database management

Web Browser (Chrome/Edge) – Running the application

Web Server

Apache HTTP Server (XAMPP) – Used to deploy and run the PHP application locally

Other Technologies

HTTP Protocol – Communication between client and server

CRUD Operations – Create, Read, Update, Delete operations

Form Handling – Collecting user input and storing in data

MODULE DESCRIPTION

1. Admin Module

The admin module allows the administrator to add, update, and delete event details. Admin can view student registrations and manage event information. This module controls the overall system and maintains event data.

1

2. Student Module

The student module allows students to view available events. Students can select events and fill the registration form. This module helps students to participate in campus events easily.

2

3

3. Event Management Module

This module is used to create and manage event details. It stores event name, date, time, and location in the database. It helps in organizing and scheduling campus events.

4

5

6

4. Registration Module

This module allows students to register for events. Student details like name, email, and phone number are stored in the database. It confirms successful registration after form submission.

7

8

5. Database Management Module

This module manages the database operations. It stores and retrieves event and registration data from MySQL database. It ensures data is stored securely and efficiently.

7

8

9

A screenshot of a web browser displaying a page titled "Student Registrations". The browser's address bar shows the URL "localhost/campus_event/view_registrations.php". The page content features a table with four columns: "Student Name", "Email", "Phone", and "Event ID". The table contains two rows of data. The first row lists "parvatareddy sravya" with email "psravya2006@gmail.com", phone "1234567899", and event ID "3". The second row lists "sushma" with email "sushma2004@gmail.com", phone "9876543211", and event ID "1".

Student Name	Email	Phone	Event ID
parvatareddy sravya	psravya2006@gmail.com	1234567899	3
sushma	sushma2004@gmail.com	9876543211	1

ADVANTAGES & LIMITATIONS

1

Advantages:

2

- Provides a centralized platform for managing all campus events.

3

- Reduces manual paperwork and administrative workload.

4

- Enables quick and easy online event registration for students.

5

- Ensures secure login with role-based access control.

6

- Provides real-time updates on event details and registration status.

7

- Maintains accurate digital records of events and participants.

8

- Improves communication between organizers and students.

9

Limitations:

- Requires stable internet connectivity to access the portal.

- Initial development and setup cost may be high.

- Requires basic technical knowledge for system maintenance.

- Data security risks if proper security measures are not implemented.

- System downtime may affect event registration processes.

- Requires regular updates and maintenance for smooth functioning.

Thank
you
